ANNUALS CARE

ANNUALS CARE

It is important to provide annual flowers with adequate moisture and a regular fertilizing program to help promote lush foliage and quality, lasting blooms.

WATERING

Within the first 2-3 weeks after installation, water the annuals every day. Use good judgment during times of rainy/wet weather. It is vital that annuals receive constant moisture within this initial 2-3 week period, as this helps promote a vigorous, well-developed root system. This initial watering practice will help to support the developing plant, its root system, foliage and bloom quality throughout the season.

After this initial 2-3 week timeframe, water as soil conditions dictate. We recommend a regular program of deep and thorough watering to maintain an evenly moist soil. Always check the soil to determine if your annuals require watering.

WATERING HINT

We suggest watering your annuals in the morning, when the temperature is cooler, thus your plants will be better suited to withstand the temperature, sunlight, and wind of the day ahead.

FERTILIZING

We highly recommend a regular program of fertilizing annuals. Regular feeding helps to promote and sustain quality foliage and blooms.

OTHER INFORMATION

1. Keep annual areas weed free.
2. Pinch off spent blooms for aesthetic purposes and to encourage the plant to continually develop blooms. Pinching off spent blooms may often lead to a fuller bushier plant.
